

AI-POWERED IT SUPPORT ASSISTANT

Project Presentation Summary

1. Executive Summary

The AI IT Support Assistant is a high-impact productivity dashboard built to bridge the gap between overwhelmed IT departments and employees needing instant technical resolutions. By leveraging Natural Language Processing and automated workflow tools, this solution transforms traditional Tier 1 support from a waiting game into an on-demand service.

2. Problem Statement & Opportunity

IT Support desks are currently the "bottleneck" of the modern workplace. High volumes of repetitive tickets cause significant downtime. This project targets the 40% of manual tasks that can be safely and effectively handled by AI, freeing human experts for high-level security and infrastructure work.

3. Key Features & Functionality

A. Conversational AI Assistant

An interactive chat interface that guides users through software troubleshooting using plain English instead of technical jargon.

Figure 1: Interactive Chatbot Interface

B. One-Click Troubleshooting Guide

A library of pre-configured "Quick Fix" buttons for the most frequent network and system errors, providing immediate expert-verified solutions.

Quick Fix Guide

1. Connection: Check
VPN & WiFi 2. System:
Restart Laptop 3. Apps:

stion...

C. Professional Email Generator

A backend productivity tool that automates the documentation process by drafting professional resolution emails for clients instantly.

The screenshot shows a web interface for 'IT Toolbox' with a section titled 'Email Generator'. It features a text input field with the placeholder 'Issue Fixed' containing the word 'phone'. Below this is a green 'Generate Email' button. A preview box shows the generated email draft with the subject 'Subject: Fixed: phone' and the body 'Hi Team, This is resolved. Ple'. To the right of the preview, a snippet of the generated email text is visible: 'my internet is not working'. Have you checked the ebar? If that fails, I can escalate this to a human'.

Figure 3: Automated Email Draft Generator

4. Responsible AI & Safety

Safety is hardcoded into the interface. The system includes a permanent disclaimer and specific "Red-Flag" detection logic. If a user describes hardware damage or potential safety risks (smoke, broken screens), the AI immediately halts troubleshooting and provides an escalation path to a human technician.
