

Candidate Name: Lutendo Ratshilumela

Project Date: 7 May 2026

1. Problem Statement

In most office environments, the IT department is the backbone of productivity, but they are often bogged down by "Tier 1" issues—repetitive problems like VPN connection errors, slow system performance, or software sync issues. For the employee, waiting 30 minutes for a ticket response for a 2-minute fix is a major productivity killer. For the IT staff, manually drafting professional status updates for every single fix is time-consuming.

I built this AI-Powered IT Support Assistant to act as the first line of defense, providing instant, interactive troubleshooting and automating the administrative side of IT support.

2. Solution Overview

The solution is a web-based dashboard built with Streamlit. It isn't just a simple chatbot; it's a productivity hub with three distinct layers:

- **Conversational Assistant:** A chatbot trained to guide users through technical hurdles without using intimidating jargon.
- **One-Click Troubleshooting:** A sidebar of pre-set "Quick Fixes" that immediately injects expert advice into the conversation for the most common company issues.
- **Automated Communication:** A tool for IT staff to instantly generate professional, ready-to-send emails once a task is completed, ensuring consistency and saving time.

3. Tools Used

- **Python & Streamlit:** I chose Streamlit for the interface because it allows for rapid prototyping and creates a clean, professional "app" feel that is easy for non-technical users to navigate.
- **Gemini/GPT:** Used to power the natural language understanding of the chatbot.
- **CSS Injection:** Used to create a "Dark Mode" aesthetic, making the tool feel like a modern IT command centre.

4. Sample Prompts

To achieve the best results, I used specific "system-level" instructions:

- **The Persona:** *"You are a Tier 1 IT specialist. If a user describes a problem, ask for the device model first. If they describe hardware damage, immediately stop and tell them to see a human tech for safety."*
- **The Simplifier:** *"Take this technical explanation of a 'DNS Flush' and rewrite it so a Marketing Manager with no IT background can follow the steps in under 60 seconds."*

5. Challenges and Solutions

- **The "Vanishing Memory" Bug:** During development, the chatbot would "forget" the previous message every time I clicked a button. I solved this by implementing **Session State**, which acts as a short-term memory for the app, keeping the conversation flow intact.
- **Human vs. AI Safety:** A major concern was the AI suggesting a "DIY fix" for something dangerous, like a smoking power supply. I solved this by hardcoding a **Responsible AI Footer** and specific "Red-Flag" triggers that redirect high-risk issues to human specialists.

6. Impact & Innovation

This assistant shifts IT from a "reactive" model to an "on-demand" model. By automating the most common 40% of IT queries and 100% of the follow-up email drafting, we can theoretically save an IT department several hours a week while reducing employee downtime. It's a simple tool with a high-scale impact on workplace efficiency.
